thermal gradients. Brine migrates toward the heat source in both types of inclusions. However, the gas phase in the two phase inclusions migrated away from the heat source. Brine migration occurs through a network of micron size channels created along the migration path.

numerical process simulation. Long-term upward brine migration is induced by overpressure in the lowest permeable formation, and the upward migration through the vertical pathway and the interaction with the intermediary permeable layers is investigated. The simulations show that brine displaced upwards through the vertical fluid pathway

Upward brine migration resulting from pressure increases

As shown by the example of brine occurrence in salt dumps, it is preferable to use the second model for real layered hydrogeological systems. Keywords: brine migration, variable density.

CO_2 can induce brine migration Brine contained in small inclusions moves towards the heat source regardless of the type of inclusion (i.e., full inclusions, two phase inclusions) In two phase inclusions a fraction of the moisture is driven away from the heat source by the gas toward cold salt Brine migration occurs through a network of $\sim 1 \mu\text{m}$

the possible migration of brine from the salt into the immediate vicinity of the waste package. Jenks and

Claiborne (1981; hereafter abbreviated J-C) have presented a "comprehensive review and analysis of available information relating to brine migration in salt surrounding radioactive waste in a salt repository."

A critique of Brine migration in salt and its implications

an important criterion should be the evaluation of brine migration resulting from the injection. We follow an interdisciplinary approach using participatory modeling to incorporate stakeholder opinion at an early stage in order to discuss and evaluate 5 model conception and relevant scenarios for brine migration.

Brine migration along vertical pathways due to CO

within interbeds. This released water may undergo significant migration in clastic zones in a manner not predicted by brine migration theory. In addition, released water encountering salt minerals will dissolve the salt until solubility limits are reached in the resulting brine. Thus, some brine migration may occur in this manner. IV ...

Structural and Hydrogeological Controls on Hydrocarbon and

Fracturing Fluid and Brine by Samuel A. Flewelling¹ and Manu Sharma² Abstract Recent increases in the use of hydraulic fracturing (HF) to aid extraction of oil and gas from black shales have raised concerns regarding potential environmental effects associated with predictions of upward migration of HF fluid and brine.

dolomitization was accomplished by long-distance migration of halite-saturated brines at temperatures near 150°C. This differs markedly from most of the Devonian in the Alberta Basin south of the Peace River Arch, where pervasive matrix dolomitization was accomplished by advection of slightly modified seawater at temperatures of about 60–80°C ...
