Accurate characterization of nanoscale surface roughness is important in many applications, and a number of techniques exist for this purpose [1, 2]. The various characterization techniques, however, are often optimal for different applications or stages of a process [], hereby requiring that the measured values are comparable between the instruments.

Comparison of optical methods for surface roughness

Silicon remains the material of choice for photovoltaics because of its abundance, non-toxicity, high and stable cell efficiencies, the maturity of production infrastructure and the deep and widespread level of skill available in relation to silicon devices.
