Cell types. Gene therapy may be classified into two types: Somatic. In somatic cell gene therapy (SCGT), the therapeutic genes are transferred into any cell other than a gamete, germ cell, gametocyte, or undifferentiated stem cell. Any such modifications affect the individual patient only, and are not inherited by offspring. Somatic gene therapy represents mainstream basic and clinical research ...

A 29-year-old British man is the first person to be treated in a gene therapy clinical trial for X-linked retinitis pigmentosa (XLRP). Robert MacLaren, MD, the lead investigator for the trial taking place at the Oxford Eye Hospital in the United Kingdom, says the patient is doing well and has gone ...

First Patient Treated in XLRP Gene Therapy Clinical Trial

In biology, a gene is a sequence of DNA or RNA that codes for a molecule that has a function. During gene expression, the DNA is first copied into RNA. The RNA can be directly functional or be the intermediate template for a protein that performs a function. The transmission of genes to an organism's offspring is the basis of the inheritance of phenotypic trait.

INTRODUCTION. Despite extensive preclinical advances, to date, there has been very limited application of DNA nucleases for therapeutic gene editing (1). Here, we describe first-in-human use of transcription activator-like effector nuclease (TALEN) gene-edited T cells in two infants with refractory relapsed B cell acute lymphoblastic leukemia (B-ALL) and the successful induction of molecular ...
