cation of the graph theoretic outlook on multiagent systems is in the context of graph processes, where the network topology itself is given a dynamic role that lends itself to analysis via system theoretic methods (Chapter 12).

Focusing on graph theoretic methods for the analysis and synthesis of dynamic multiagent networks, the book presents a powerful new formalism and set of tools for networked systems. The book's three sections look at foundations, multiagent networks, and networks as systems.

A simple, graph-oriented database model, supporting object-identity, is presented. For this model, a transformation language based on elementary graph operations is defined. This transformation language is suitable for both querying and updates.

Graph-theoretic techniques used to study completion problems are discussed. Several new results are also presented, including the solution to the M0-matrix completion problem and the sign symmetric P0-matrix completion problem. 1. Classes of Matrices A partial matrix is a matrix in which some entries are specified and others are not.
